ABOUT ME

Passionate software engineer that strives for high quality and constant learning. Throughout my education and projects I have acquired a tool set for learning, critical problem solving skills, software methodologies and architecture. I sincerely enjoy solving real world problems with software development. I thrive in teams, enjoy sparring with colleagues. I do not shy away from difficult challenges and I am not afraid to ask questions, to ensure the problems are solved correctly.

EDUCATION

Masters in Software Engineering

University of Southern Denmark

Sep. 2023 – Jun. 2025

Odense, DK

Bachelors in Software Engineering

University of Southern Denmark

Sep. 2020 – Jun. 2023

Odense, DK

PROJECTS

Master thesis: Satellite-Based Detection of Pesticide Overuse

Masters 3-4th semester

Tools: GIS, MySQL, API's, RabbitMQ, Docker

- A case from the Danish Environmental Protection Agency (DA: Miljøstyrelsen).
- Used API endpoints from Sentinel-2 satellites to calculate vegetation indices for potatoes fields in Denmark.
- The data was collected during the desiccation period, where farmers use pre-harvest crop desiccants to stunt the growth of the potatoes prior to harvest, where an unusually steep drop in vegetation index could indicate an overuse of pre-harvest desiccant.

Bachelor project: Flexible Software Architectures

Bachelors 6th semester

Tools: Microservices, Apache Kafka, Docker

- A case from TV 2. Created a mock up of their video platform, TV 2 Play, using a microservice architecture.
- Three different services were implemented, containerized and able to be scaled independently of each other.
- Communication between services was done in a publish/subscribe pattern. The project focused on availability and load balancing.

Embedded Linux Project: Wildlife Camera

Masters 2nd semester

Tools: Bash/shell, python, Embedded Linux, WiFi-Networking

- Built a mockup system of a wildlife camera monitoring system, using various sensors, ESP32 and a Raspberry Pi.
- Implemented wireless image offloading to a PC when a drone connects the wildlife cameras local Wi-Fi, simulating fly-over data collection.
- Designed a return-to-base workflow where collected images are transferred to a server for post-processing.
- Drone offloads the images to a server, also simulated by the PC, and images are annotated by a local Large Language Model (LLM)

SKILLS

Languages : Python, Java, C#, SQL, HTML/CSS.

Frameworks & Technologies : Git, Docker, Kubernetes, RestAPI's, MQTT, node.js, React

Databases : MySQL, PostgreSQL, NoSQL, MongoDB, Redis.

Platforms : GitHub, Trello, Figma, Notion.
